

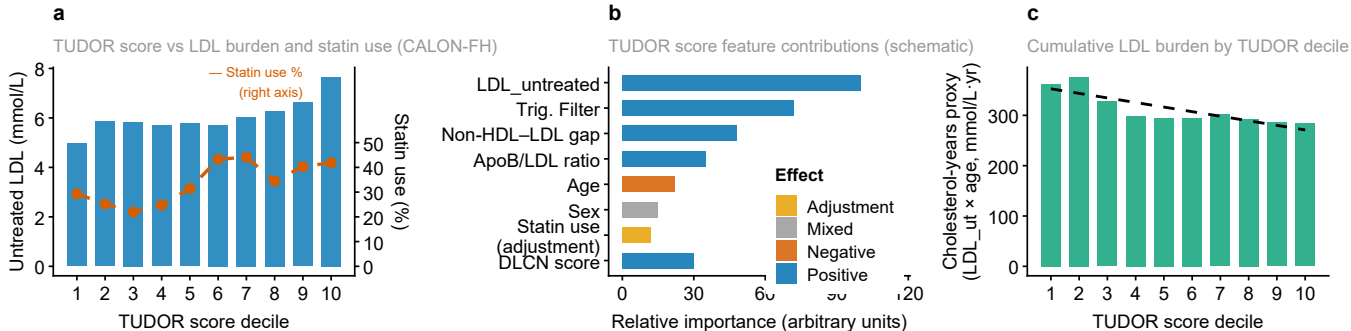

Figure 5 | TUDOR score architecture and penetrance gradient.

a, Mean untreated LDL (bars) rises monotonically across TUDOR deciles; statin use (dashed line) peaks in mid-deciles, demonstrating the treatment paradox captured by the score.

b, Schematic representation of TUDOR feature contributions; LDL_{untreated} and Triglyceride Filter are the dominant features.

c, Cholesterol-years proxy (LDL_{untreated} × age) by TUDOR decile, confirming cumulative atherogenic burden increases with score.

LDL, low-density lipoprotein; TF, Triglyceride Filter.
